The cracked soil can be represented as an overlapping continuum of pore media and crack media. As such, in this study, the pore-crack dual media model has been used to simulate the unsaturated seepage in the cracked soil. In this paper, a computational framework based on the material point method (MPM) is developed to study the coupled seepage-erosion-deformation

process within unsaturated soils. Based on the mixture theory, the unsaturated erodible soil is conceptualized as a three-phase multi-species porous medium, which is represented as a set of Lagrangian material points in a three-phase multi-species single point MPM framework.

Although a lot of work on unsaturated soil seepage has been conducted, the unsaturated seepage in vacuum drainage conditions is not fully studied. The current study of vacuum drainage method is limited to saturated seepage. Pan and Huang et al. [21, 22] analyzed

the mechanism of vacuum tube dewatering by laboratory experiment and field test. The lack of research leads to the weak theoretical and computational basis of vacuum drainage, which severely limits the development of the method.
