Abstract. Sediment transport capabilities have been added to the Hydrologic Engineering Center's River Analysis System program (HEC-RAS). HEC RAS can perform mobile bed sediment routing computations with quasi steady (histogram) flow series data. For each flow in the time series a water surface profile is calculated.

Hydrologic mass conservation is the biggest advantage of unsteady sediment

transport, making reservoir models and even multi-reservoir cascade models much more practical in HEC-RAS. However, coupling sediment transport to the unsteady flow capabilities also brings several powerful features, native to the unsteady hydraulic analysis environment, into sediment transport analyses including: lateral structures, flow networks, mixed flow (figure), and especially operational rules (Gibson and Boyd ...

First of all, I know that HEC-RAS V5.0.3 cannot compute sediment transport in 2D areas and that is not my goal ! A 1D/2D model was built for a study in order to compute WSE, Velocities and overflows. But the next step is to analyse the sediment transport.

HEC-RAS Help - Sediment 1D/2D

HEC-6 is designed to incorporate these interactions into the simulation. Sediment Transport Modeling HEC-6

simulates the capability of a stream to transport sediment, given the yield from upstream sources. This computation of transport includes both bed and suspended load as described by Einstein's Bed-Load Function.

HEC-6 Features

The HEC-RAS 4.2 model was applied for modelling sediment dynamics. Based on 5 years of bed change measurements, the model was calibrated by varying the considered sediment transport function. New features for HEC-RAS model analysis also were added.
