Spectral Fatigue Analysis

Spectral fatigue analysis. In a spectral fatigue analysis wave loads are computed for deterministic waves of different periods and heights and from different directions.

Any wave theory may be used, i.e. Airy, Stokes 5th, Stream Function, etc. An analysis of the structure subjected to these waves is then performed. This may be a static or a dynamic analysis.

SPECTRAL-BASED FATIGUE ANALYSIS FOR VESSELS

In general, spectral based fatigue analysis may be performed by carrying out computation of wave induced loads in frequency domain for the loading conditions for specific vessel type, application of loads to the structural model to generate the stress Response Amplitude Operators (RAOs) and

then obtaining the response spectrum at each location of interest by considering the environment.

Guidelines on Spectral Fatigue Analysis of Ship Structures

Spectral-based Fatigue Analysis is a complex and numerically intensive technique. As such, there is more than one variant of the method that can be validly applied in a particular case. ABS does not wish to preclude the use of any valid variant of a Spectral-based Fatigue Analysis method by “over specifying” the elements of an approach.

Spectral analysis For either of the spectral analysis methods, damage is calculated in the frequency domain by statistical methods. In either case, the calculation requires a power spectral density function (PSD) for response, obtained as follows. For a frequency domain analysis, the PSD is obtained from a frequency domain simulation.

The OrcaFlex fatigue analysis tool is a post-processor which calculates fatigue damage using a variety of methods. Fatigue damage is collated and summed for specified load cases and then presented in graphs or tables. The fatigue analysis tool is essentially a self-contained sub-program within OrcaFlex, with its own menus, data and results.

Fatigue analysis: Introduction - Orcina

Fatigue analysis itself usually refers to one of two methodologies. The stress-life (or S-N method), is commonly referred to as the total life method since it makes no distinction between initiating or growing a crack. This was the first fatigue

analysis method to be developed over 100 years ago.

Due to the excessive sensitivity of estimated fatigue damage to Weibull parameters, spectral fatigue assessment has become more popular for offshore structural analysis (Chen and Mavrakis, 1988). Fatigue analysis and design includes several steps of analysis:
