The two important modes of action of aminoglycosides have been documented best for streptomycin; other aminoglycosides probably act similarly. Both inhibition of the initiation complex and misreading of messenger RNA (mRNA) occur; the former is probably more important for the bactericidal activity of the drug. An initiation complex composed of a streptomycin-treated 30S subunit, a 50S subunit, and mRNA will not function—that is, no peptide bonds are formed, no

polysomes are made, and a ...
