Carbon fibre reinforced polymer (CFRP) is one of the most important materials for structural applications, particularly in aviation industries owing to its high strength to weight ratio. CFRP contains extremely thin carbon fibres (CFs) of about 0.005 - 0.010 mm in diameter in polymeric matrices leading to light weight composite structures. At a microscopic scaled level, carbon

The feasibility of Laser-Assisted Direct Joining (LADJ) of Carbon Fibre Reinforced Polymer (CFRP) with thermosetting matrix to polycarbonate sheets is investigated in this work. The process was performed by means of a high-power diode laser with a maximum power of 200 W. Experimental tests were carried out by varying the main process conditions including the laser power and scanning speed.

In this study, a novel laser joining process was developed for carbon-fibre-reinforced polymer and aluminum and/or steel. Methods of forming a layer that is more chemically inactive than the metal to be joined with composites, i.e. aluminum oxide on aluminum and stainless steel on steel, through laser surface texturing and cladding processes, are evaluated to improve the corrosion resistance of the joints.

Abstract. Friction stir interlocking (FSI), a new derivative friction stir welding, was used to lap join AZ31 magnesium sheet and thermoset carbon fiber reinforced polymer (TS-CFRP) sheet. Instead of directly joining AZ31 and TS-CFRP, a series of magnesium interlocks were used to friction stir weld with AZ31 sheet to enable joining with TS-CFRP.

JOINING OF FIBRE-REINFORCED POLYMER COMPOSITES

In order to increase the mechanical

stability, Carbon Fibre Reinforced Polymer (CFRP) composite face sheets can be used in heat pipe radiator panels . Moreover, the coefficient of thermal expansion (CTE) mismatch between aluminium and CFRP could lead to internal stresses under operating conditions (i.e. an operating temperature range of between -30°C to 90°C in satellites).
