The Master's Theorem states: CASE 3 - if $f(n) = \Omega(n \log^b a + \epsilon)$ for some $\epsilon > 0$, and if $af(n/b) \leq cf(n)$ for some $c < 1$ and all sufficiently large n , then $T(n) = \Theta(f(n))$. By the use of these three cases, we can easily get the solution of a recurrence equation of the form $T(n) = aT(n/b) + f(n)$.

Master's Theorem for analysis of algorithms

Intuitively, the master theorem argues that if an asymptotically positive function f is added to the recurrence so that one instead has. $T(n) = aT(n/b) + f(n)$, $T(n) = aT(\frac{n}{b}) + f(n)$, $T(n) = aT(bn) + f(n)$, it is possible to determine the asymptotic form of T based on a relative comparison between f and $n \log_b a$.

In the analysis of algorithms, the master theorem for divide-and-conquer recurrences provides an asymptotic analysis (using Big O notation) for recurrence relations of types that occur in the analysis of many divide and conquer algorithms. The approach was first presented by Jon Bentley, Dorothea Haken, and James B. Saxe in 1980, where it was described as a "unifying method" for solving such ...
