Angles Formed By Secants And

The angle formed by the intersection of 2 tangents, 2 secants or 1 tangent and 1 secant outside the circle equals half the difference of the intercepted arcs! Therefore to find this angle (angle K in the examples below), all that you have to do is take the far intercepted arc and near the smaller intercepted arc and then divide that number by two!

x° : is the angle. formed by a tangent and a secant. The outer arc is 143° . The inner arc is 63° . Then $x = [1/2] (143 - 63)$. $143 - 63 = 80$. $[1/2] \cdot 80 = 40$. So $x = 40$.

In words: the angle made by two secants (a line that cuts a circle at two points) that intersect outside the circle is half of the furthest arc minus the nearest arc. Why not try drawing one yourself, measure it using a protractor, and see what you get? It also works when either line is a tangent (a line that just touches a circle at one point).

Angle of Intersecting Secants Theorem - MATH

An angle is outside a circle if its vertex is outside the circle and its sides are tangents or secants. The possibilities are: an angle formed by two tangents, an angle formed by a tangent and a secant, and an angle formed by two secants.

Angles Outside a Circle (Read) | Geometry | CK-12 Foundation

The angle created by two secant lines is equal to half the measure of the difference in measure of the two created arcs. So angle CAE is just the measure of arc CE minus the measure of arc BD.

The Intersecting Secants Theorem states $AB \cdot AD = AC \cdot AE$.

Additionally, there is a relationship between the angle created by the secant line segments and the two arcs, shown in red and blue below, that subtend the angle. Secants AB and AC form $\angle BAC$ which intersects circle O, creating arcs BC (in red) and DE (in blue).
