The program was performed in two stages: the first stage registration of DICOM images (CT-MRI) using intensity based registration, the reason of choosing this method is the simplest and least complicated, And the second stage the implementation of the fusion algorithm on the registered images using wavelet based image fusion, Also reason for choosing this method to achieve the best results possible by combining

both techniques of registration and image fusion.

Image fusion combines two or more images through a color transformation process. Depending on the application, different fps and/or resolution may be needed. Yet the specifics of the image-processing algorithm may frequently change causing redesign. If the target platform is FPGA, usually rapid yet optimized hardware implementation is required.
