For rotational motion, the same force can cause very different results. A torque is an action that causes objects to rotate. A torque is required to rotate an object, just as a force is required to move an object in a line. Torque is created by force, but it also depends on where the force is applied and the point about which the object rotates. For example, a door pushed at its handle will easily turn and open, but a door pushed near its hinges will not move as easily.

The formula for torque is: $\tau = r \times F = rF \sin \theta$ So for an angle of 60° : $\tau = (0.84 \text{ m})(45 \text{ N}) \sin(60^\circ) = 32.7 \text{ Nm} \approx 33 \text{ Nm}$ If the force is applied at an angle of 90° to the radius, the $\sin$ factor θ becomes 1, then the torque value is: $\tau = rF = (0.84 \text{ m})(45 \text{ N}) = 37.8 \text{ Nm} \approx 38 \text{ Nm}$ Problem #2

Torque and Rotation - Physics

Torque (also known as moment, or moment of force) is the tendency of a force to cause or change

the rotational motion of a body. It is a twist or turning force on an object. Torque is calculated by multiplying force and distance. It is a vector quantity, meaning it has both a direction and a magnitude.

Torque in Physics: Definition and Examples

τ is the torque (Rotational ability of a body) ω is the angular velocity (rate of change of angular displacement). represent the dot product or scalar product; The above equation can be rearranged to compute the torque required to achieve given angular velocity and Power. The torque injects power and it purely depends on instantaneous velocity.

Relation Between Torque And Power - Formula, Derivation

Torque is a measure of the force that can cause an object to rotate about an axis. Just as force is what causes an object to accelerate in linear kinematics, torque is what causes an object to acquire angular acceleration. Torque is a vector quantity. The direction of the torque vector depends on the direction of the force on the axis.

Torque (article) | Khan Academy

Also known as moment of force or simply moment, torque refers to the rotational force to rotate an object about a pivot, fulcrum, axis. The concept of torque is very similar to force – meaning that force is all about pushing and pulling an object, while torque is something that causes an object to twist or rotate.

Torque is a measure of how much a force acting on an object causes that object to rotate. The object rotates about an axis, which we will call the pivot point, and will label 'O'. We will call the force 'F'. The distance from the pivot point to the point where the force acts is called the moment arm, and is denoted by 'r'.

In physics and mechanics, torque is the rotational equivalent of linear force. It is also referred to as the moment, moment of force, rotational force or turning effect, depending on the field of study.The concept originated with the studies by Archimedes of the usage of levers.Just as a linear force is a push or a pull, a torque can be thought of as a twist to an object around a specific axis.
