Banach Algebras And The General

This first volume is an independent, self-contained reference on Banach algebra theory. Each topic is treated in the maximum interesting generality within the framework of some class complex algebras rather than topological algebras. In both volumes proofs are presented in complete detail at a level accessible to graduate students.

In mathematics, especially functional analysis, a Banach algebra, named after Stefan Banach, is an associative algebra A over the real or complex numbers (or over a non-Archimedean complete normed field) that at the same time is also a Banach space, that is, a normed space that is complete in the metric induced by the norm. The norm is required to satisfy

For a general commutative Banach algebra A, such a definition was only possible under some

restrictions on f; if $x_1, \dots, x_k$ are any elements of A, their joint spectrum is the image in $\mathbb{C}^k$ of the mapping $\chi \rightarrow (\chi(x_1), \chi(x_2), \dots, \chi(x_k))$ where χ runs through $X(A)$ (for $k = 1$, it is of course the spectrum of x_1); one then could prove that if B is the algebra of (germs of) functions f holomorphic in a neighbourhood (depending on f) of the joint spectrum of $x_1, \dots, x_k$, there is a ...

To show this, let $\mathfrak{g}_d$ denote the vector space direct sum of $\mathfrak{l}$ with the field of scalars $\mathfrak{o}$. Then elements of $\mathfrak{g}_d$ are pairs $(x, 0)$, where $x \in \mathfrak{l}$ and $0 \in \mathfrak{o}$. With norm defined by the relation $\| (x, 0) \|_1 = \| x \|_1$, $\mathfrak{g}_d$ is a normed linear space and is a Banach space if and only if $\mathfrak{l}$ is a Banach space.

Besides providing examples of such Banach algebras, a lot of work has been done in finding applications, that is, in showing that various problems can be successfully resolved in $\mathfrak{z}$ -Banach algebras (see the recent papers [2, 5] and references therein).
