PSA process has 33% lower cost of manufacture (COM) than E-DWC process. EG solvent loss is the key contributing factor to higher COM of E-DWC process. Need for more cooling water and for HP steam also resulted in higher COM of E-DWC. Optimal capacity of PSA process for bioethanol recovery/purification is ~400,000 m³.

Abstract. The large-scale production of bioethanol fuel requires energy-demanding distillation steps to concentrate the diluted product streams from the fermentation step and to overcome the azeotropic behavior of the ethanol-water mixture. The conventional separation sequence

consists of three distillation columns performing several tasks with high energy penalties:

preconcentration of ethanol (PDC), extractive distillation (EDC) and solvent recovery (SRC).
