This is because chemical reactions involve the electromagnetic force which is weak compared to the strong nuclear force that holds the nucleus together (as you can tell by its name). This means oxygen atoms will always remain oxygen atoms and hydrogen atoms will always remain hydrogen atoms, even when they are involved in chemical reactions.

Heartburn is caused by a buildup of excessive amounts of stomach acid, particularly HCl. This acid is used to digest the food we eat, but it can often back up into the esophagus causing that burning sensation many of us are familiar with. The symptoms of heartburn can be treated with a mild base, which acts to neutralize the excess HCl.
