THEORY OF OPERATION: The Francis turbine is a reaction turbine, which means that the working fluid changes pressure as it moves through the turbine, giving up its energy. A casement is needed to contain the water flow. The turbine is located between the high

pressure water source and the low pressure water exit, usually at the base of a dam.

Work done by the stage is. (6.12) $W = m g c U \Delta V w = m g c U (2 C_1 \cos \alpha - U)$ In a reaction stage there is an enthalpy drop in the rotor blade, so the energy available to the rotor blade is given by. (6.13) $E = m g c \{ C_1^2 + V_2^2 - V_1^2 \} = m g c (C_1^2 - V_1^2)$ (since $V_2 = C_1$).

Reaction Turbine - an overview | ScienceDirect Topics

Reaction turbines are a type of turbine that develops torque by reacting to the gas or fluid's pressure or mass. The operation of reaction turbines is described by Newton's third law of motion (action and reaction are equal and opposite). In a reaction turbine, the water enters the wheel under pressure and flows over the vanes, As the water, flowing over the vanes, is under pressure, therefore wheel of the turbine runs full and may be submerged below the tailrace or may discharge into ...

reaction turbines is such as to reduce the flow area and increase the velocity. The shape of the moving blades however is not the same for impulse and reaction turbines. The moving blades of impulse turbines do not have a change in flow area. They do not therefore change the velocity of the steam but only change its direction.

WORKING OF KAPLAN TURBINE: The Kaplan turbine is an inward flow reaction turbine, which means that the working fluid changes pressure as it moves through the turbine and gives up its energy. The design combines radial and axial features. The inlet is a scroll-shaped tube that wraps around the turbine's wicket gate.

Impulse and reaction turbines - SlideShare

In general, reaction turbine is not stand alone, but works at behind impulse turbine whether constructed in one rotor or at separated rotor, but still connected by coupling. The purpose of impulse turbine is to control speed and reduce steam enthalpy to specified level. Reaction turbine is just receiving steam condition from impulse blades.

1. In an impulse turbine, the steam flows through the nozzle and strike on the moving blades. In the reaction turbine, first, the steam flows through the guide mechanism and then flows through the moving blades. 2. Steam strikes on the buckets with kinetic energy.
