Real-Time Embedded Systems and Applications. A real-time embedded system is a real-time computer system (hardware and software) that is part of a larger system (called a real-time system or cyber-physical system) that typically has mechanical and/or electrical parts, such as an airplane or automobile. A real-time embedded system interfaces to the external environment through sensors and actuators, as depicted in Figure 1.1.

Real-Time Software Design for Embedded Systems

These design concepts are building blocks in designing the software architecture of a real-time embedded system: the overall structure of the system, its decomposition into components, and the interfaces between these components. Section 3.1 provides an overview of object-oriented concepts.

A real-time computer system needs both an operating system that operates in real-time and user code that delivers deterministic execution. Neither deterministic user code on a non-real-time operating system or nondeterministic code on a real-time operating system will result in real-time performance. Some examples of real-time environments:

Introduction to Real-Time Systems

Real-Time systems are classified from a number of viewpoints i.e. on factors outside the computer system and factors inside the computer system. Special emphasis is placed on hard and soft real-time systems. A missed deadline in hard real-time systems is catastrophic and in soft real-time systems it can lead to a significant loss.

Real-Time Systems

Real-time computing, or reactive computing is the computer science term for hardware and software systems subject to a "real-time constraint", for example from event to system response. Real-time programs must guarantee response within specified time constraints, often referred to as "deadlines". Real-time responses are often understood to be in the order of milliseconds, and sometimes microseconds. A system not specified as operating in real time cannot usually guarantee a response within any t

Real-time computing - Wikipedia

A real-time system is any information processing system which has to respond to externally generated input stimuli within a finite and specified period – the correctness depends not only on the logical result but also the time it was delivered – failure to respond is as bad as the wrong response!
