YEAR 12 PHYSICS LESSON 2: PROJECTILE MOTION

The ballistic pendulum apparatus consists of a launcher, a projectile, and a pendulum. Attached to the swinging end of the pendulum is a bucket designed to catch the projectile and hold it, creating an inelastic collision. The bucket rests directly in front of the launcher, right at the exit point of the projectile (fig. 1).

Ballistic Pendulum and Conservation of Momentum

From the motion of a steel ball projected horizontally, the initial velocity of the ball can be determined from the measured range. For a given initial velocity, the projectile range will be measured for various initial angles, and also calculated by applying the theory for motion with constant acceleration.

Projectile Motion - Boston University

In conclusion, this lab allowed us to investigate projectile motion by determining the initial velocity given to the ball and ultimately predict the range of a projectile. Projectile Motion equations were used to predict the range in this projectile motion lab.
