If the propeller pitch is too low (lower in inches) the engine can run over the desired WOT RPM which can lead to engine damage, or to the engine protecting itself with a rev limiter. If the

prop pitch is too high (higher in inches) the motor may run below the WOT range—called “lugging the engine”—which can also put undue stress on engine and gearcase components.

the fact that at low airspeeds, propeller efficiency is very low. As airspeed increases, so does efficiency, quickly at first, then more slowly, up to its maximum (about 85-87%), and then falls off beyond the peak That trend is also shown by the outline of the Maximum Efficiency Envelope in Figure 1.

Propeller Performance: An introduction, by EPI Inc.

While much research has been carried out on propellers for full-scale aircraft, not much data exists on propellers applicable to the ever growing number of UAVs. Many of these UAVs use propellers that must operate in the low Reynolds number range of 50,000 to 100,000 based on the propeller chord at the 75% propeller-blade station.
