Seismic Design - an overview | ScienceDirect Topics

Seismic design forces are determined on the basis of earthquake risk levels associated with different regions. Seismic risk levels have been traditionally characterized as low, moderate and high. These risk levels are considered in structural design to produce buildings with compatible seismic performance levels.

SEISMIC DESIGN - Chapter 6 - Engineering

The aforementioned seismic measures are used to calculate forces that earthquakes impose on buildings. Ground shaking (pushing back and forth, sideways, up and down) generates internal forces within buildings called the Inertial Force (FInertial), which in turn causes most seismic damage. FInertial = Mass (M) X Acceleration (A).

uses the Seismic Design Category (SDC) concept to categorize structures according to the seismic risk they could pose. There are six SDCs rang- ing

5.1 Seismic Design Categories

Seismic analysis is a subset of structural analysis and is the calculation of the response of a building structure to earthquakes. It is part of the process of structural design, earthquake engineering or structural assessment and retrofit in regions where earthquakes are prevalent. As seen in the figure, a building has the potential to 'wave' back and forth during an earthquake. This is called the 'fundamental mode', and is the lowest frequency of building response. Most buildings, however, hav

Seismic analysis - Wikipedia

The inertial force demands tend to control the seismic design for isolated or heavy components, whereas the imposed deformations are important for the seismic design for elements that are continuous through multiple levels of a structure or across expansion joints between adjacent structures, such as cladding or piping.

Design for Nonstructural Components

Seismic building codes have traditionally had the goal of protecting life safety by preventing major damage under a postulated earthquake shaking condition. This goal was accomplished by using an equivalent static lateral force (lateral force) applied to the building and designing each component based on the resulting shears and moments.

Some Concepts in Earthquake Behaviour of Buildings

There is a resurgence of high rise and ultra-high rise building construction around the world. The design of these tall buildings in seismically active regions varies dramatically from region to region.

Recommendations for the Seismic Design of High-Rise Buildings

Structural configuration plays an important role on the seismic behavior of structures. In recent earthquakes, structures with inappropriate distributions of strength and stiffness have performed poorly, and most of the observed collapses have been related to some extent to configuration problems or wrong conceptual design.
