Maglev (derived from magnetic levitation) is a system of train transportation that uses two sets of magnets: one set to repel and push the train up off the track, and another set to move the elevated train ahead, taking advantage of the lack of friction. Along certain "medium-range" routes (usually 320 to 640 km [200 to 400 mi]), maglev can compete favourably with high-speed rail and airplanes.

Working with a heavy ball slows down arm- and shoulder-movement speed, just as running up hills slows striding rate, but it increases total muscular force production (to overcome the greater resistance provided by the heavier ball), just as running uphill makes leg muscles create greater force.
