A Ghost Cell Immersed Boundary

Abstract. An efficient ghost-cell immersed boundary method (GCIBM) for simulating turbulent flows in complex geometries is presented. A boundary condition is enforced through a ghost cell method. The reconstruction procedure allows systematic development of numerical schemes for treating the immersed boundary while preserving the overall second-order accuracy of the base solver.

To this end, a general boundary condition treatment, using the ghost-cell immersed boundary method for compressible flows, is developed and validated in the present work. The interaction between immersed bodies and the fluid is expressed by ghost points inside the immersed bodies, and these ghost points ensure that boundary conditions are satisfied precisely on the immersed boundary.

Ghost-cell immersed boundary method In GCIB method, at first all grid nodes are flagged as fluid points, solid points or ghost points. Then variable value on ghost point is interpolated from boundary conditions and fluid variables near the boundary. Boundary conditions are implicitly incorporated into flow field through ghost points.

In the conventional ghost-cell immersed boundary method the boundary forcing term f is implemented implicitly in the momentum equation in order to enforce the boundary condition at each time step . Hence, f is not evaluated explicitly and is set to 0 in the computation. Instead, the boundary forcing is implicitly coupled to the convective and diffusive terms in Eq.

A sharp-interface ghost-cell immersed-boundary method is coupled with a mass source and sink algorithm to improve the conservation of mass across non-grid conforming immersed boundaries. To facilitate the control for the temporal discontinuity in the flow field due to a motion of an immersed body, a fully-implicit time-integration scheme is employed.

An alternative sub-method of direct forcing, named ghost-cell immersed boundary method, is also used by some researchers , for complex geometries. In this method, the ghost cell (solid node which has at least one neighbouring fluid node) is given a velocity such that the interpolated velocity at the solid surface is equal to the desired velocity to be imposed.

A novel ghost-cell immersed boundary method for fully resolved simulation of char particle combustion has been developed. The boundary conditions at the solid particle surface, such as velocity, temperature, density, and chemical species concentration, are well enforced through the present method. Two semiglobal heterogeneous reactions and one homogeneous reaction are used to describe the chemical reactions in the domain, and the Stefan flow caused by the heterogeneous reactions is considered.
