The Oxford Handbook of Clinical Psychology

Updated Edition *Oxford University Press*

The exponential growth of clinical psychology since the late 1960s can be measured in part by the extensive--perhaps exhaustive--literature on the subject. This proliferation of writing has continued into the new century, and the field has come to be defined as much by its many topics as its many voices. The Oxford Handbook of Clinical Psychology synthesizes these decades of literature in one extraordinary volume. Comprising chapters from the foremost scholars in clinical psychology, the handbook provides even and authoritative coverage of the research, practice, and policy factors that combine to form today's clinical psychology landscape. In addition to core sections on topics such as training, assessment, diagnosis, and intervention, the handbook includes valuable chapters devoted to new and emerging issues in the clinical field, including health care reforms, cultural factors, and technological innovations and challenges. Each chapter offers a review of the most pertinent literature,

outlining current issues and identifying possibilities for future research. Featuring two chapters by Editor David H. Barlow -- one on changes during his own 40-year odyssey in the field, the other projecting ten themes for the future of clinical psychology -- The Oxford Handbook of Clinical Psychology is a landmark publication that is sure to serve as the field's benchmark reference publication for years to come. It is an essential resource for students, clinicians, and researchers across the ever-growing clinical psychology community.

The Handbook of Psychiatric Measures offers a concise summary of key evaluations that you can easily incorporate into your daily practice. The measures will enhance the quality of patient care assisting you, both in diagnosis and assessment of outcomes. Comprising a wide range of methods available for assessing persons with mental health problems, the Handbook contains more than 275 rating methods, from the Abnormal Involuntary Movement Scale to the Zung Self-Rating Depression Scale. In this fully revised edition, more than 40 measures have been added both to the book and to the accompanying CD-ROM. The Handbook features: Thoroughly examined and revised measures that provide the most relevant and timely information for clinicians. New measures that empirically provide better patient evaluation Updated costs, translations, and contact information for each measure This handy compendium includes both diagnostic tools and measures of symptoms, function and quality of life, medication side effects, and other clinically relevant parameters.

It focuses on measures that can be most readily used in either clinical practice or research. Most of the measures are designed to improve the reliability and validity of patient assessment over what might be accomplished in a standard clinical interview. The measures also demonstrate that the use of formal measures can improve the collection, synthesis, and reporting of information as compared with the use of unstructured examinations. Seventeen disorder-specific chapters, organized in DSM-IV-TR order, include measures for: Disorders of childhood and adolescence Cognitive disorders Sexual dysfunction Eating disorders Sleep disorders Aggression and much more. The discussion of each measure includes goals, description, practical issues, psychometric properties, and clinical utility, followed by references and suggested readings. This revised edition includes updated measure descriptions, new measure variants and research, and newly selected measures particularly appropriate to the domain of discussion. As a clinical tool, this book Describes how, when, and to what purpose measures are used Points out practical issues to consider in choosing a measure for clinical use Addresses limitations in the use of measures including ethnic, cultural, and socioeconomic factors that influence their interpretation Use of this special resource is further enhanced by a CD-ROM containing the full text of more than 150 of these measures -- an invaluable aid for reference and clinical decision-making.

Using Individual Participant Data Meta-analysis to Evaluate the Diagnostic Accuracy of the Patient Health Questionnaire-9

"Background: The Patient Health Questionnaire-9 (PHQ-9) has been recommended for screening to identify patients with depression. Conventional meta-analyses on PHQ-9 diagnostic accuracy have been limited by selective cutoff reporting in primary studies and have not examined accuracy for different diagnostic interview types used as reference standards or different participant subgroups.Objectives: To use an individual participant data (IPD) meta-analysis approach to (1) evaluate

the association between diagnostic interview method and odds of major depression classification; (2) determine PHQ-9 diagnostic accuracy for different reference standards and participant subgroups; and (3) conduct a simulation to demonstrate variability in optimal cutoffs and the resulting exaggeration of accuracy estimates when small samples are used to select an optimal cutoff and determine its accuracy.Methods: Electronic databases were searched from January 2000 until February 2015 for datasets that compared PHQ-9 scores to major depression classification from validated diagnostic interviews. Primary study data and study-level data extracted from primary reports were synthesized into a large IPD database. To evaluate the association between diagnostic interview method and odds of major depression classification, binomial generalized linear mixed models were fit. To estimate PHQ-9 diagnostic accuracy, bivariate random-effects meta-analyses were used to estimate pooled sensitivity and specificity for cutoffs 5-15. To demonstrate variability in sample-specific optimal cutoffs and resulting exaggeration of accuracy estimates, samples of size 100, 200, 500, and 1000 were drawn with replacement from the IPD database, and optimal cutoffs and their accuracy estimates were compared to those from the full database.Results: Data from 58 of 72 eligible studies were obtained and synthesized (17,436 participants; 2,322 cases). Among fully structured interviews intended for lay administration, odds of major depression were higher for the brief Mini International Neuropsychiatric Interview (MINI) compared to the more in-depth Composite International Diagnostic Interview (CIDI). Compared to semi-

structured interviews designed for clinician administration, fully structured interviews (MINI excluded) were less likely to classify major depression among participants with high-level depressive symptoms. PHQ-9 sensitivity estimates compared to semi-structured interviews were greater than compared to fully structured interviews and greater than reported in previous meta-analyses that combined reference standards. A cutoff of ≥ 10 maximized combined sensitivity and specificity overall and for subgroups. When samples of size 100 were drawn from the IPD database, sample-specific optimal cutoffs ranged from 3-19. Compared to estimates based on the full database, sample-specific optimal cutoffs overestimated sensitivity by 10% and underestimated specificity by 4%. When sample size increased to 1000, the range of optimal cutoffs narrowed to 6-12, and sample-specific optimal cutoffs overestimated sensitivity by only 5%; specificity was again underestimated by 4%. Conclusions: Semi- and fully structured diagnostic interviews should not be considered equivalent reference standards for major depression. PHQ-9 diagnostic accuracy compared to semi-structured interviews is greater than previously reported, and a cutoff of ≥ 10 can be used regardless of participant characteristics. Using data-driven methods to select an optimal cutoff in small samples leads to exaggerated accuracy estimates, although the extent of sensitivity exaggeration reduces as sample size increases. This thesis demonstrated and overcame shortcomings in existing research and generated accurate, unbiased estimates of PHQ-9 diagnostic accuracy. Results can be used to improve our ability to conduct trials that will determine whether screening for

depression could be effective"--

Guide to Psychological Assessment with Asians *Springer*

To effectively serve minority clients, clinicians require a double understanding: of both evidence-based

practice and the cultures involved. This particularly holds true when working with Asian-Americans, a diverse and growing population. The Guide to Psychological Assessment with Asians synthesizes real-world challenges, empirical findings, clinical knowledge and common-sense advice to create a comprehensive framework for practice. This informed resource is geared toward evaluation of first-generation Asian Americans and recent immigrants across assessment methods (self-report measures, projective tests), settings (school, forensic) and classes of disorders (eating, substance, sexual). While the Guide details cross-cultural considerations for working with Chinese-, Japanese-, Korean and Indian-American clients, best practices are also included for assessing members of less populous groups without underestimating, overstating or stereotyping the role of ethnicity in the findings. In addition, contributors discuss diversity of presentation within groups and identify ways that language may present obstacles to accurate evaluation. Among the areas covered in this up-to-date reference: Structured and semi-structured clinical interviews. Assessment of acculturation, enculturation and culture. IQ testing. Personality disorders. Cognitive decline and dementia. Mood disorders and suicidality. Neuropsychological assessment of children, adolescents and adults. Culture-bound syndromes. Designed for practitioners new to working with Asian clients as well as those familiar with the population, the Guide to Psychological Assessment with Asians is exceedingly useful to neuropsychologists, clinical psychologists, health psychologists and clinical social workers.

Is Newton's brain different from Rembrandt's? Does a mother's diet during pregnancy impact brain growth? Do adolescent peers leave a signature in the social brain? Does the way we live in our middle years affect how our brains age? To answer these and many other questions, we can now turn to population neuroscience. Population neuroscience endeavors to identify environmental and genetic factors that shape the function and structure of the human brain; it uses the tools and knowledge of genetics (and the "omics" sciences), epidemiology and neuroscience. This text attempts to provide a bridge spanning these three disciplines so that their practitioners can communicate easily with each other when working together on large-scale imaging studies of the developing, mature and aging brain. By understanding the processes driving variations in brain function and structure across individuals, we will also be able to predict an individual's risk of (or resilience against) developing a brain disorder. In the long term, the hope is that population neuroscience will lay the foundation for personalized preventive medicine and, in turn, reduce the burden associated with complex, chronic disorders of brain and body.

Handbook of Clinical Interviewing With Children *SAGE Publications*

The Handbook of Clinical Interviewing with Children is one of three interrelated handbooks on the topic of interviewing for specific populations. It presents a combination of theory and practice plus concern with diagnostic entities for readers who work, or one day will work, with children (and their parents and teachers) in clinical settings. The volume

begins with general issues (structured versus unstructured interview strategies, developmental issues when working with children, writing up the intake interview, etc.), moves to a section on major disorders with special relevance for child populations (conduct disorders, attention-deficit hyperactivity disorder, learning disorders, etc.), and concludes with a section addressing special populations.

Topics in this issue include: Guidelines and quality standards for adult epilepsy patients; Guidelines and quality standards in care of children with epilepsy; Initial evaluation of the patient with suspected epilepsy; Starting, choosing, changing, and discontinuing treatment; Methods for measuring seizure frequency and severity; Assessment of treatment side effects and quality of life; Screening for depression and anxiety; Counseling patients on driving and employment; Issues for women with epilepsy; Patient education (SUDEP - Sudden Unexpected Death in Epilepsy; Self-management;

Focus Groups

A Practical Guide for Applied Research *SAGE*

'I read this book in a single sitting. It is written in an enthusiastic, helpful and clear style that held my attention, and made me want to read what came next. I shall read it again in a single sitting - probably more than once. For it offers common-sense advice about planning

and running focus groups which I will want to revisit' - British Journal of Education Technology The Third Edition of the 'standard' for learning how to conduct a focus group contains: a new chapter comparing and contrasting market research, academic, nonprofit and participatory approaches to focus group research; expanded descriptions on how to plan focus group studies and do the analysis, including step-by-step procedures; examples of questions that ask participants to do more than just discuss, and suggestions on how to answer questions about your focus group research.
