characteristic, or the ROC curve. The ROC curve is a graphical plot of how often false alarms (x-axis) occur versus how often hits (y-axis) occur for any level of sensitivity. The advantage of ROC curves is that they capture all aspects of Signal Detection theory in one graph. The more the curve bends up to the right, the better the sensitivity.

Receiver operating characteristic (ROC) curves have their origin in signal detection theory. Since the outcome of a particular condition in a yes-no signal detection experiment can be represented as an ordered pair of values (the hit and false-alarm rates), it is useful to have a way to graphically present and interpret them.

Signal Detection Theory - an overview | ScienceDirect Topics

ROC ANALYSIS IN THEORY AND PRACTICE 5 (pAUC) is measured without reference to any theory. It is simply a measure of the area under the empirically obtained ROC points. For a given set of ROC data, there is only one estimate of pAUC, and this is the objective measure that policymakers should care about.

ROC Analysis in Theory and Practice

The starting point for signal detection theory is that nearly all reasoning and decision making takes place in the presence of some uncertainty. Signal detection theory provides a precise language and graphic notation for analyzing decision making in the presence of uncertainty. The general approach of signal detection theory has direct application for us in terms of sensory experiments.

ROC curves were invented during WWII to help radar operators decide whether the signal they were getting indicated the presence of an enemy aircraft or was just noise. (O'Hara et al. specifically refer to the Battle of Britain, but I haven't been able to track that down.)

The ROC curve is created by plotting the true positive rate (TPR) against the false positive rate (FPR) at various threshold settings. The true-positive rate is also known as sensitivity, recall or probability of detection in machine learning.

This curve is called the receiver operating characteristic (ROC). When d' is 0, the noise and the signal + noise curve are the same and false alarms and hits will be the same.
