A simple and common interview question for digital designers is to write Verilog code to generate Gray Code. I've seen two ways to accomplish this. The first method is converting the binary counter to Gray Code using a case statement. However, there is an easier method, a more general use method that you should be aware of also.

RTL Verilog. In the digital circuit design, register-transfer level (RTL) is a design abstraction which models a synchronous digital circuit in terms of the data flow between hardware register, and the logical operations performed on those signals. Register-transfer-level abstraction is used in HDL to create high-level representations of a circuit, from which lower-level representations and ultimately actual wiring can be derived.
