Soil Mechanics Experiments

The soil mechanics experiment had two primary objectives: to enhance the scientific understanding of the nature and origin of the materials and the mechanisms and processes responsible for the present morphology and consistency of the lunar surface and to provide engineering data on the interaction of manned systems and manned operations with the lunar surface.

The AASHTO Soil Classification System classifies soils into seven primary groups, named A-1 through A-7, based on their relative expected quality for road embankments, sub-grades, sub-bases, and bases. Some of the groups are in turn divided into subgroups, such as A-1-a and A-1-b. Furthermore, a Group Index may be calculated to quantify

GEOTECHNICAL LABORATORY EXPERIMENTS

Soil mechanics studies are used to determine lateral earth pressure, bearing capacity of soil, and conduct slope stability analysis. These studies always help a civil engineer to design and construct better structures and indirectly these studies help in risk mitigation too because if we know beforehand how the soil mass is going to behave, we can take precautionary measures at the time of construction itself.

In order to calculate the specific gravity of a soil the following relations should be known: $G_s = \text{unit weight or density of soil solid} / \text{unit weight or density of water}$. $G_s = W_s / (V_s * \rho_w)$ Where: W_s : mass of soil solid (gm) V_s : volume of solid (cm³) ρ_w : density of water (gm / cm³) Since $V_s = V_w$ $G_s = W_s / W_w$ $W_w = (W_s + W_1) - W_2$.
