It is traditional for eddy current calibration groups (collections of related data) to have 3 calibration scans in a row. Also, a calibration file is usually labeled with a 999. This tradition was inherited from tube testing. Tube testing is the most common type of eddy current testing. Vessels have their tubes labeled by row and column or by X ...

Eddy current testing (ECT) as a technique for testing finds its roots in electromagnetism. Eddy currents were first observed by François Arago in 1824, but French physicist Léon Foucault is credited with discovering them in 1855. ECT began largely as a result of the English scientist Michael Faraday 's discovery of electromagnetic induction in 1831.

Eddy-current testing - Wikipedia

An eddy current array, in its simplest form, is a series of single elements arranged in a row, allowing users to cover a larger area in a single pass than conventional, single-coil probes (i.e., pencil probes using). However, this could lead to suboptimal results. That's why ECA probes use multiplexing.

In electromagnetic induction, eddy currents flow in a direction opposite to the coil current and thus also producing a counter force, or “secondary” field. The circuitry in an ECT system is normalized (a.k.a., “balanced”) to this opposing secondary field. If the coil is moved to a location on the sample with a defect, the flow of eddy currents is disrupted, causing their paths and density to change.

Eddy Current Array (ECA) is a form of nondestructive eddy current testing that involves electronically driving eddy current coils placed next to each other in a probe assembly. Each coil in the probe produces a signal, the strength of which depends on the phase and amplitude of the object the probe is placed over.

Eddy current array (ECA) is a nondestructive testing technology that provides the ability to electronically drive multiple eddy current coils, which are placed side by side in the same probe assembly. Each individual eddy current coil in the probe produces a

signal relative to the phase and amplitude of the structure below it.

Alternating current injected into a coil creates a magnetic field (in blue). When the coil is placed over a conductive part, opposed alternating currents (eddy currents, in red) are generated. Defects in the part disturb the path of the eddy currents (in yellow). This disturbance can be measured by the coil. Eddy current array (ECA) technology provides the ability to electronically drive multiple eddy current coils placed side by side in

the same probe assembly.
