Water passes through the lipid bilayer by diffusion and by osmosis, but most of it moves through special protein channels called aquaporins. Explanation: Water can diffuse through the lipid bilayer even though it's polar because it's a very small molecule.

Water Movement Through Lipid Bilayers, Pores and Plasma ...

This monograph on the water permeability of lipid bilayers and cell membranes provides a theoretical framework for treating water movement across membranes. The book includes a review of the results of water permeability measurements on artificial lipid bilayer membranes, and discusses permeability data on biological membranes.

Abstract. This paper, the fourth of a series, is concerned with the movement of water across the bilayer lipid membrane (BLM). The water permeability coefficients, P_o , were determined for BLM formed from oxidized cholesterol, cholesterol-DAP (dodecyl acid phosphate), and cholesterol-HDTAB (hexadecyltrimethylammonium bromide).

While each bilayer stops the ions and slows the movement of water, it can only hold back a certain pressure. Water will continually leach into or out of the cell. Different types of organisms have different strategies for dealing with water loss, most depending on proteins within the lipid bilayer or extracellular support structures (cell walls) to help mitigate water and ions appropriately.

Water Movement Through Lipid Bilayers, Pores and Plasma ...

Uncatalysed movement of phospholipids between the bilayers is possible, but this is slow and cannot be relied upon to maintain the asymmetry equilibrium. Instead, lipid translocator proteins catalyse phospholipid movement between the bilayers. Flippases move phospholipids from the outer leaflet to the inner leaflet.

How do lipid bilayer components move? | MBInfo

The anomalously large permeability of water through bilayers is still not completely understood and continues to be the subject of active debate. Small uncharged apolar molecules diffuse through lipid bilayers many orders of magnitude faster than ions or water. This applies both to fats and organic solvents like chloroform and ether. Regardless of their polar character larger molecules diffuse more slowly across lipid bilayers than small molecules.
