Soil play a significant environmental role in balancing the climate as it currently acts as a carbon sink, sequestering CO₂ from the atmosphere into soil organic carbon. On the other side, soil organic carbon is released to the atmosphere as a consequence of land use change, degradation processes and climate change. Soil erosion, which is likely to be exacerbated due to the more intense precipitation events expected as a result of climate change, leads to the displacement of soil and the ...

Generally, three primary processes including: soil organic carbon (SOC) turnover, soil inorganic carbon (SIC) transformation, and soil erosion, would lead to changes of soil carbon, especially in the C-rich surface layer (Don et al., 2011; Lal, 2001; Monger et al., 2015).

Processes Regulating Changes in Soil Carbon Stocks. There is an underlying assumption that increased photosynthesis and above-ground biomass will increase carbon inputs and retention as SOM. However, increases in primary production often result in increased removal of biomass by grazing or cutting (Mackay et al., 2018). Further, biomass removal ...

Management of Grazed Landscapes to Increase Soil Carbon ...

Soil respiration is a key ecosystem process that releases carbon from the soil in the form of carbon dioxide. Carbon is stored in the soil as organic matter and is respired by plants, bacteria, fungi and animals. When this respiration occurs below ground, it is considered soil respiration. Temperature, soil moisture and nitrogen all regulate the rate of this conversion from carbon in soil organic compounds to CO₂. Many methods are used to measure soil respiration; however, the closed ...

Carbon sequestration or carbon dioxide removal (CDR) is the long-term removal, capture or sequestration of carbon dioxide from the atmosphere to slow or reverse atmospheric CO₂ pollution and to mitigate or reverse global warming.. Carbon dioxide (CO₂) is naturally captured from the atmosphere through biological, chemical, and physical processes. These changes can be accelerated through changes ...

Soil Carbon models: Models that simulate cycling of soil C to estimate components of soil C budgets, such as: (1) The carbon pool of soil; (2) Changes in the carbon pool of soil over time; and (3) Carbon dioxide emissions from soil as a result of

decomposition of organic carbon compounds in soil (heterotrophic soil respiration). The soil C models used in model-based soil C monitoring systems are generally dynamic (i.e., they account for time) rather than static.
