Section 12.2 Pushdown Automata A pushdown automaton (PDA) is a finite automaton with a stack that has stack operations pop, push, and nop. PDAs always start with one designated symbol on the stack. A state transition depends on the input symbol and the top of the stack. The machine then performs a stack operation and enters the next state.

As we are dealing with nondeterministic pushdown automaton, the result of applying δ is a finite set of (q, x) pairs. Graphical Notation of pushdown automata (PDA): Pushdown automata are not usually drawn. However, with a few minor extensions, we can draw an PDA similar to the way we draw an finite automata.

Although the general problem of checking context-free properties of pushdown automata is undecidable, algorithmic solutions have been proposed for checking some kinds of non-regular properties. In particular, Alur et al. recently introduced the logic CaRet. CaRet is a linear temporal logic that can specify some non-regular properties.

Pushdown Automata (PDA) Pushdown automata is a way to implement a CFG in the same way we design DFA for a regular grammar. A DFA can remember a finite amount of information, but a PDA can remember an infinite amount of information. Pushdown automata is simply an NFA augmented with an "external stack memory".

Pushdown Automata - Javatpoint

Pushdown Automata A pushdown automaton (PDA) is a finite automaton equipped with a stack-based memory. Each transition is based on the current input symbol and the top of the stack, optionally pops the top of the stack, and optionally pushes new symbols onto the stack. Initially, the stack holds a special symbol Z_0 that indicates the bottom of the stack.

Solved: 1. Pushdown Automata Wikipedia

Pushdown automata are computational models—theoretical computer-like machines—that can do more than a finite state machine, but less than a Turing machine. Pushdown automata accept context-free languages, which include the set of regular languages. The language that describes strings that have matching parentheses is a context-free language. Say that a programmer has written some code, and in order for the code to be valid, any parentheses must be matched.

Non-deterministic Finite Automaton (NFA / DFA) Deterministic Finite Automaton (DFA) In DFA, for each input symbol, one can determine the state to which the machine will move. Hence, it is called Deterministic Automaton. As it has a finite number of states, the machine is called Deterministic Finite Machine or Deterministic Finite Automaton.
