Aging And Lung Disease Author

Natural lung aging is associated with molecular and physiological changes that cause alterations in lung function, diminished pulmonary remodeling and regenerative capacity, and increased susceptibility to acute and chronic lung diseases. As the aging population rapidly grows, it is essential to examine how alterations in cellular function and cell-to-cell interactions of pulmonary resident cells and systemic immune cells contribute to a higher risk of increased susceptibility to infection ...

Aging and Lung Disease.

Lung capacity begins to decline in mid-life. This decline is steeper for those with lung disease and for smokers; however, even among those who have never smoked, there is considerable variation in both maximal lung capacity and the subsequent rate of decline.

Several lung diseases have aging as a risk factor, including IPF and COPD, and hallmarks of cellular aging are associated with the pathobiology of age-related lung diseases. For instance, patients with IPF have short telomeres regardless of telomerase mutations, and type II epithelial cells from IPF lungs have alterations in the mitochondrial dynamics and function.

The ageing lung. On average, the human lung is growing until the age of 10–12 years and matures further until it reaches its maximum function at the age of ~20 years of age for females and ~25 years for males [].From then on, lung function progressively declines with increasing age as a consequence of structural and physiological changes to the lung [].

Ageing is the main risk factor for major non-communicable chronic lung diseases, including chronic obstructive pulmonary disease, most forms of lung cancer and idiopathic pulmonary fibrosis. While the prevalence of these diseases continually increases with age, their respective incidence peaks at

different times during the lifespan, suggesting specific effects of ageing on the onset and/or ...

Lee, Shin, and Kang next review the impact of aging on T-cell immunity, as this could lead to an increased vulnerability for developing viral infections, inflammatory diseases (eg, asthma and chronic obstructive lung disease), and malignancies. Based on current evidence, the authors conclude that a range of alterations in T-cell immunity occurs with aging, from cell function to the proportion of T-cell subsets, but that their clinical significance has yet to be elucidated, particularly ...

Aging is a common risk factor for the occurrence and development of many diseases, such as Parkinson's disease, Alzheimer's disease, diabetes, hypertension, atherosclerosis and coronary heart disease, and cancer, among others, and is a key problem threatening the health and life expectancy of the elderly.

Aging and disease

Telomere shortening has been associated with several lung diseases. However, telomere length is generally measured in peripheral blood leucocytes rather than in lung tissue, where disease occurs. Consequently, telomere dynamics have not been established for the normal human lung nor for diseased lung tissue. We hypothesized an age- and disease-dependent shortening of lung tissue telomeres.
