Constant Solutions Of Differential Equations

Here, our constant solutions help: Our differential equation has two of them, $y(t) = 0$ and $y(t) = 1$, found by finding the zeros of the right hand side. This implies, that all solutions with initial values in between 0 and 1 STAY THERE, because due to local uniqueness they CANNOT cross the constant solutions.

Examples of Differential Equations Example 1. We saw the following example in the Introduction to this chapter. It involves a derivative, $\frac{dy}{dx}$: $\frac{dy}{dx} = x^2 - 3$ As we did before, we will integrate it. This will be a general solution (involving K , a constant of integration). So we proceed as follows: $y = \int (x^2 - 3) dx$ and this gives $y = x^3/3 - 3x + K$
