Reversed phase Gel filtration Introduction Biomolecules are purified using chromatography techniques that separate them according to differences in their specific properties, as shown in Figure 1. Hydrophobic interaction chromatography (HIC) separates biomolecules, under relatively mild conditions, according to differences in their hydrophobicity.

Hydrophobic Interaction and Reversed Phase Chromatography ...

The main difference between reverse phase and hydrophobic interaction chromatography is that the reverse phase chromatography (RPC) uses a more hydrophobic medium, which leads to more stronger interactions whereas the hydrophobic interaction chromatography (HIC) uses a less hydrophobic medium when compared to the medium in the reverse phase chromatography.

Fausnaugh JL, Kennedy LA, Regnier FE. The variable hydrophobic nature of proteins allows their separation through differential

hydrophobic surface interactions. From these observations two modes of protein chromatography have been developed, hydrophobic-interaction chromatography (HIC) and reversed-phase chromatography (RPC). Selectivity of the HIC column can be easily manipulated by changing mobile phase variables.

In reversed phase liquid chromatography (RPLC), one uses hydrophobic interactions between the biological molecules and the ligands on the chromatographic support to obtain separation. RPLC stationary phases differ from HIC packings by a higher density of hydrophobic ligands.

Hydrophilic interaction chromatography is a variant of normal phase liquid chromatography that partly overlaps with other chromatographic applications such as ion chromatography and reversed phase liquid chromatography. HILIC uses hydrophilic stationary phases with reversed-phase type eluents. The name was suggested by Dr. Andrew Alpert in his 1990 paper on the subject. He described the chromatographic mechanism for it as liquid-liquid partition chromatography where analytes elute in order of in

Poor-quality eluent components can cause a phenomenon referred to as “ghosting”. Trace levels of organic impurities bind to the medium, concentrating during equilibration and sample application.

Troubleshooting Reversed Phase Chromatography (RPC ...

Reversed-phase chromatography employs a polar mobile phase. As a result, hydrophobic molecules in the polar mobile phase tend to adsorb to the hydrophobic stationary phase, and hydrophilic molecules in the mobile phase will pass through the column and are eluted first. Hydrophobic molecules can be eluted from the column by decreasing the polarity of the mobile phase using an organic (non-polar) solvent, which reduces hydrophobic interactions. The more hydrophobic the molecule, the more ...

Reversed-phase chromatography - Wikipedia

Reversed-phase SPE is considered the least selective retention mechanism when compared to normalphase or ion-exchange SPE. In other words, it may be difficult for a reversed-phase method or bonded chemistry to differentiate between molecules that are structurally similar. However, because reversed-phase will retain most molecules with any hydrophobic character, it is very useful for extracting analytes that are very diverse in structure within the same sample.

In hydrophobic interaction (reversed-phase) liquid chromatography, increasing the molecular size increases the hydrophobicity of analytes and results in a longer retention time. This indicates that van der Waals (VW) volume is an important property in optimization.

Hydrophobic (lipophilic) Interaction Liquid Chromatography

Hydrophobic-Interaction Chromatography [HIC] HIC is a type of reversed-phase chromatography that is used to separate large biomolecules, such as proteins. It is usually desirable to maintain these molecules intact in an aqueous solution, avoiding contact with organic solvents or surfaces that might denature them.
