INTRODUCTION TO HILBERT SPACES It is trivial to verify that the Euclidean space $\mathbb{R}^n$ is a real vector space. However, the notion of a vector space is much more general. For example, let V be the space of all continuous functions on $\mathbb{R}^n$, with pointwise addition and scalar multiplication defined the same way as for real numbers.

This leads to the following definitions:
Definition 1. A set S of vectors in a pre-Hilbert space CP is said to be total in case the only vector z of CP which is orthogonal to every vector of S is the vector $z = ()$. A sequence (finite or infinite) of vectors x_n is called a total sequence in case: if $z \perp x_n$ for all n , then $z = ()$.

From the Hilbert space model came the abstraction of "quantum logics". This book explores all three stages, but not in historical order. Instead, in an effort to illustrate how physics and abstract mathematics influence each other we hop back and forth between a purely mathematical development of Hilbert space, and a physically motivated definition of a logic, partially linking the two throughout, and then bringing them together at the deepest level in the last two chapters.
