Angular momentum is a vector quantity (more precisely, a pseudovector) that represents the product of a body's rotational inertia and rotational velocity (in radians/sec) about a particular axis. However, if the particle's trajectory lies in a single plane, it is sufficient to discard the vector nature of angular momentum, and treat it as a scalar (more precisely, a pseudoscalar).

Or if you solve for tangential velocity, you get v is equal to ωr . And so if you substitute back into this, really this definition for angular momentum, you get angular momentum is equal to mass times this times r . So mass times, I'm just substituting for velocity here, times ωr , times r . Which of course is just ωr^2 .
