Plant Breeding For Abiotic Stress

To cope with abiotic stress, plants can initiate a number of molecular, cellular, and physiological changes to respond and adapt to such stresses. Better understanding of the plant responsiveness to abiotic stress will aid in both traditional and modern breeding applications towards improving stress tolerance.

Plant Abiotic Stress

As a result, many areas that have been considered marginal for growing crops, due to their low fertility, drought, salinity, and many other abiotic stresses, have now been incorporated in the production system. Additionally, climate change has brought new challenges to agriculture to

produce food, feed, fiber and biofuels.

Plant Breeding for Abiotic Stress Tolerance | SpringerLink

To cope with these new challenges, many plant breeding programs have reoriented their breeding scope to stress tolerance in the last years. The authors of this book have collected the most recent advances and discoveries applied to breeding for abiotic stresses in this book, starting with new physiological concepts and breeding methods, and moving on to discuss modern molecular biological approaches geared to the development of improved cultivars tolerant to most sorts of abiotic stress.

When a group of different plant species was prompted by a variety of different stress signals, such as drought or cold, each plant responded uniquely. Plant Breeding Because individual plants react so differently to similar abiotic stress factors, it can be difficult to breed a species for more than one resilient trait at a time, but that is precisely what plant breeders are looking to do.

Abstract. Camelina (Camelina sativa (L.) Crantz] (Brassicaceae) is a plant currently being researched as an alternative oilseed crop.The interest in Camelina is growing rapidly because the species has several agronomic advantages: high productivity, low-input agriculture, cold weather tolerance, short growing season (85-100 days), grows well in semi-arid regions, and low-fertility or saline ...

(PDF) Breeding for Abiotic Stress Tolerance in Crop Plants

One of the most important abiotic stresses affecting plants is water stress. A plant requires a certain amount of water for its optimal survival; too much water (flooding stress) can cause plant cells to swell and burst; whereas drought stress (too little water) can cause the plant to dry up, a condition called desiccation. Either condition can be deadly to the plant. Temperature Stress

Abiotic stress tolerant plant varieties particularly in rice are proving to be boon for the farmers.

However, only host gene is not enough under high stress severity or where crop is exposed to multiple stresses like flooding, drought and diseases. Similarly microbes alone may not be enough to provide proper protection against abiotic stresses.
