The Protein Folding Problem And

The Protein Folding Problem is the obstacle that scientists confront when they try to predict 3D structure of proteins based on their amino acid sequence. Although it is known that a given sequence of amino acids almost always folds into a 3D structure with certain functions, it is impossible to predict, with high precision, the exact folding pattern.

Protein folding must be thermodynamically favorable within a cell in order for it to be a spontaneous reaction. Since it is known that protein folding is a spontaneous reaction, then it must assume a negative Gibbs free energy value. Gibbs free energy in protein folding is directly related to enthalpy and entropy. For a negative delta G to arise and for protein folding to become ...
