In this chapter we also explore two special types of motion in two dimensions: projectile motion and circular motion. Last, we conclude with a discussion of relative motion. In the chapter-opening picture, each jet has a relative motion with respect to any other jet in the group or to the people observing the air show on the ground.

84 Chapter 3 SCALARS AND VECTORS In Chapter 2 our discussion of motion was limited to two directions, forward and backward. Mathematically, we described these directions of motion with a positive or negative sign. This chapter explains a method of describing the motion of objects that do not travel along a straight line.

3.0: Prelude to Two-Dimensional Kinematics Motion not confined to a plane, such as a car following a winding mountain road, is described by three-dimensional kinematics. Both two- and three-dimensional kinematics are simple extensions of the one-dimensional kinematics developed for straight-line motion in the previous chapter.

Section 4.2: Projectile Motion. An object subject to a constant acceleration at an angle relative to its motion will move in a two-dimensional path known as its trajectory. Most of the objects we encounter will be subject to the constant acceleration due to the gravitational force. Any object subject to gravity is known as a projectile.

2-D Projectile Motion The trajectory of a 2-D projectile is a parabola. The horizontal lines demonstrate that the vertical motion of the balls are identical in both cases. The vertical spacing is increasing due to the acceleration of the vertical velocity. The horizontal spacing of the yellow ball is constant.
