FPGA Programming for a Software World. FPGAs have been around for years to solve hardware design problems. Their programmability was done exclusively in terms familiar to hardware designers instead of via any programming language designed for software development. New FPGA designs aimed at supporting software development instead of just hardware replacement designs, coupled with new

software development tools, make FPGA programming worth a serious look by software developers.

The explicit difference between FPGA programming and software programming

is the way that its instructions are executed. In term of the execution of instructions, instructions in software programming (C, Ada, etc.) are sequentially executed while Verilog/VHDL instructions in FPGA programming are mostly parallelly executed (except blocking assignment in Verilog and variable assignment within a process in VHDL).

Finally, just as embedded programs are often embedded in physical ROM, flash, or downloaded live, FPGA programs (compiled, synthesized, placed, and routed) must be embedded in the physical FPGAs. The actual programming file may be a .HEX or similar. Programmers typically download or burn the bits from these files into the hardware.
