Membrane Technologies For Water Treatment

One key issue that often plagues the implementation of membrane technologies for water treatment is fouling. Fouling happens over time, when molecules, debris, cells and materials accumulate on the surface of the membrane, significantly degrading their performance. Membrane fouling leads to higher energy consumption because water has to be “pushed through” additional materials that have collected on the membrane surface.

Membrane Technology - Water Treatment and Purification

Historically, nanofiltration and other membrane technology used for molecular separation was applied entirely on aqueous systems. The original uses for nanofiltration were water treatment and in particular water softening. Nanofilters can "soften" water by retaining scale-forming, hydrated divalent ions (e.g. Ca^{2+} , ...

Nanofiltration - Wikipedia

Mocanu and others developed a synthetic procedure for hybrid ultrafiltration membrane for water treatment. They used wet-phase inversion method with polysulfone and graphene nanoplatelets modified with poly (styrene) to obtain their membranes. ZnO was deposited on one surface of the membrane with polymers that are soluble in water [39].
