Criteria Basic Feasible Solution

In the theory of linear programming, a basic feasible solution is a solution with a minimal set of non-zero variables. Geometrically, each BFS corresponds to a corner of the polyhedron of feasible solutions. If there exists an optimal solution, then there exists an optimal BFS. Hence, to find an optimal solution, it is sufficient to consider the BFS-s. This fact is used by the simplex algorithm, which essentially travels from some BFS to another until an optimal one is found.

Notice that in the final solution, the basic variables are all non-zero. In a degenerate LP, it is also possible that even in the final solution, some of the basic variables will be zero. One other thing to note is that x_1 was an entering variable in one iteration, and a leaving variable in another.

First, look at whether each possible solution met your design requirements. Consider solutions that did a much better job than others, and reject those that did not meet the requirements. Some criteria apply to virtually every design. Good designers consider these universal design criteria when choosing which possible solution to implement:
