The cell cycle is the complex sequence of events by which cells grow and divide. In eukaryotic cells, this process includes a series of four distinct phases. These phases consist of the Mitosis phase (M), Gap 1 phase (G 1), Synthesis phase (S), and Gap 2 phase (G 2). The G 1, S, and G 2 phases of the cell cycle are collectively

referred to as interphase.

Phases of the Cell Cycle. The cell cycle is a 4-stage process consisting of Gap 1 (G1), Synthesis, Gap 2 (G2) and mitosis. An active eukaryotic cell will undergo these steps as it grows and divides. After completing the cycle, the cell either starts the process again from G1 or exits the cycle through G0. From G0, the cell can undergo terminal differentiation.

The cell cycle, or cell-division cycle, is the series of events that take place in a cell that cause it to divide into two daughter cells. These events include the duplication of its DNA (DNA replication) and some of its organelles, and subsequently the partitioning of its cytoplasm and other components into two daughter cells in a process called cell division.

Cell cycle - Wikipedia

The two main parts of the cell cycle are mitosis and interphase. Mitosis is the phase of cell division, during which a "parent cell" divides to create two

“daughter cells.” The longest part of the cell cycle is called “interphase” – the phase of growth and DNA replication between mitotic cell divisions.

Coupling the cell cycle to cell growth - PubMed Central (PMC)

In eukaryotic cells, or cells with a nucleus, the stages of the cell cycle are divided into two major phases:

interphase and the mitotic (M) phase. During interphase, the cell grows and makes a copy of its DNA. During the mitotic (M) phase, the cell separates its DNA into two sets and divides its cytoplasm, forming two new cells.

Phases of the cell cycle (article) | Khan Academy

The cell cycle. Actively dividing eukaryote cells pass through a series of stages known collectively as the cell cycle: two gap phases (G1 and G2); an S (for synthesis) phase, in which the genetic material is duplicated; and an M phase, in which mitosis partitions the genetic material and the cell divides.

The Cell Cycle, Mitosis and Meiosis – University of Leicester

Cancer is basically a disease of uncontrolled cell division. Its development and progression are usually linked to a series of changes in the activity of cell cycle regulators. For

example, inhibitors of the cell cycle keep cells from dividing when conditions aren't right, so too little activity of these inhibitors can promote cancer.
