We have two variables. p =position on the track (measured by path length along the track) v =velocity. We pick some point on the track to be position $p=0$ and pick a direction along the track to be positive. Then the position is equal to the length of the track, from the origin to that point.

Physics This simulation is a variation of the Roller Coaster with Spring, please see that page for more information on the physics and how the simulation is done. The difference here is that the other end of the spring is attached to another ball on the track, instead of being fixed. We have 4 variables in this simulation:

Activity A asks students to use a simulation to determine which factors affect the velocity of a toy car during moving along a roller coaster track. During Activity B, students use a more massive toy car to investigate how energy is transferred from one form to another as a roller coaster moves and determine the maximum velocity of the toy car can attain without breaking the egg.

When the roller coaster cart travels down hill it accelerates (the velocity increases), and when the roller coaster cart travels up hill it decelerates (the velocity decreases). We are able to calculate the velocity of the roller coaster cart at any time by using the formulas given on the Motion page. The mass of the roller coaster cart will remain constant if the cart is empty; however, as people will be riding into the cart, the mass of the people also needs to be taken into account.

Physics of Loops The primary force that makes one feel a particular set of sensations is the acceleration, and the section of a roller coaster that exploits this acceleration (more accurately known as centripetal acceleration) are the clothoid loops. A clothoid loop assumes the geometric shape of a teardrop.

The Physics Of Roller Coasters » Science ABC

Gravity applies a constant downward force on the cars. The coaster tracks serve to channel this force — they control the way the coaster cars fall. If the tracks slope down, gravity pulls the front of the car toward the ground, so it accelerates. If the tracks tilt up, gravity applies a downward force on the back of the coaster, so it decelerates.
