Reproductive Allocation In Plants Physiological

Reproductive Allocation in Plants describes why plants differ in the proportion of their resources that they allocate to reproduction and looks into the various theories. This book examines the ecological and evolutionary explanations for variation in plant reproductive allocation from the perspective of the underlying physiological mechanisms controlling reproduction and growth.

Top 6 Processes of Plant Physiology - Biology Discussion

Reproductive allocation can then be defined as the fraction of inflorescence and floral meristems, and somatic allocation as the fraction of other meristem types out of all meristems of a plant. If the estimation of proportions of reproductive and vegetative parts is found to be a suitable method to measure reproductive allocation, it may be more straightforward to count meristems than to delimit reproductive and vegetative parts in some other way.

Meristem Allocation as a Means of Assessing Reproductive ...

The reproductive costs hypothesis states that plant resource allocation or development is limited such that an increase in ongoing plant reproduction incurs a reduction in fitness, quantified as reduced future fecundity or survival (Levins, 1968; Karlsson and Méndez, 2005). The main assumption in the hypothesis of reproductive costs is that a trade-off occurs in the distribution of resources at the physiological level, either towards vegetative growth or towards reproduction.
