Organic Luminescent Materials

Dear Colleagues, Luminescent materials are increasingly attractive, fundamentally for their beauty and intriguing features and practically for their potential applications in devices and probes. Organic luminescent materials have become valuable alternatives to inorganic luminophores but are still rare, because most organic chromophores suffer a dramatic quenching of their emission when they pass from dilute solutions to concentrated solutions or to solid states.

Later, other materials, such as certain metal oxides, silicates, and phosphates, were found to luminesce if they were prepared by special procedures. Sulfide-type phosphors, activators, fluxes. The sulfides of zinc and of cadmium are the most important basic materials of sulfide-type phosphors. An important condition of getting highly efficient phosphors is that these sulfides must first be prepared to the highest possible chemical purity before the necessary amount of activator can be added ...

An organic light-emitting diode (OLED or organic LED), also known as organic electroluminescent (organic EL) diode, is a light-emitting diode (LED) in which the emissive electroluminescent layer is a film of organic compound that emits light in response to an electric current. This organic layer is situated between two electrodes; typically, at least one of these electrodes is transparent.
