The problems are chosen to demonstrate the most common patterns in 1 H NMR spectroscopy, as well as, the situations where you need to consider the possibility of signal overlapping, incorrect absolute values of integrations, as the instrument measures only the relative area for each peak, examples where fairly large molecules give rise to spectra with few signals because of the symmetry elements. We will also discuss the purpose of shaking the sample with deuterated solvents.

NMR Problem Set

We've been putting together a small library of practice 1 H NMR spectra for our students, so we thought we'd post them here. We hope you find them useful! In these spectra, each peak is labeled with its ppm chemical shift

along the top, while the integration values (relative number of hydrogens—remember that integration values are relative!) appear below each peak.

In each of these problems you are given the IR, NMR, and molecular formula. Using this information, your task is to determine the structure of the compound. The best approach for spectroscopy problems is the following steps: Calculate the degree of unsaturation to limit the number of possible structures.

Let's try a ^1H NMR practice problem with $\text{C}_4\text{H}_7\text{Cl}$: Remember from previous sections that to solve an NMR

spectrum with double bonds, we must know the Degrees of Unsaturation. From this, we get degrees of unsaturation = $(9-7)/2=1$ so there is one pi bond or ring in our molecule. Next we must look at the integration of the NMR spectrums.
