Turbulent flow separation in over-expanded rocket nozzles is investigated numerically in a sub-scale parabolic nozzle fed with cold nitrogen. Depending upon the feeding to ambient pressure ratio either a free shock separation or a restricted shock separation is computed, with a significant hysteresis between these two flow regimes. This hysteresis was also found in experimental tests with the ...

Abstract: In this study, an efficient numerical technique for transmission characteristic analysis of finite planar frequency selective surface (FSS) with multilayered media is presented by using the multilevel adaptive cross approximation (MLACA). The computational scheme is based on the mixed-potential electric field integral equation (MPIE) with multilayered media Green's functions (MLGFs).

In the first part of the paper, numerical investigation of flow transition (FSS→RSS) has been performed to understand the formation of the cap-shock pattern, which is believed to be the main cause for this flow transition from FSS to RSS. Axisymmetric numerical calculations on a wide range of NPRs (15–25) are performed to reproduce the forward transition process and are found to be in good agreement with the experiments.

In a model with a single explanatory variable, RSS is given by:
$$RSS = \sum_{i=1}^n (y_i - f(x_i))^2$$
 where y_i is the i th value of the variable to be predicted, x_i is the i th value of the explanatory variable, and $f(x_i)$ is the predicted value of y_i (also termed $\hat{y_i}$).

Numerical predictions show a remarkable good agreement with experimental data. In particular, the FSS → RSS transition is correctly captured by axisymmetric modelling. The analysis of the flowfield across the shock pattern leads to a simple criterion for the FSS → RSS transition to occur.
