Chapter 5 Weathering and Soil. Learning Objectives. After carefully reading this chapter, completing the exercises within it, and answering the questions at the end, you should be able to: Explain why rocks formed at depth in the crust are susceptible to weathering at the surface. Describe the main processes of mechanical weathering, and the types of materials that are produced when mechanical weathering predominates.

Chapter 5 Weathering, Soil, and Mass Movements Summary 5.1 Weathering Mechanical weathering occurs when physical forces break rock into smaller and smaller pieces without changing the rock's mineral composition. In nature, three physical processes are especially important causes of mechanical weathering: frost wedging, unloading, and biological activity.

Chapter 5 Weathering and Soil - Physical Geology

Section 5.2 Soil. Weathering produces a layer of rock and mineral fragments called regolith. Soil. is part of the regolith that supports the growth of plants. Soil has four major components: mineral matter, or broken down rock; organic matter, or humus, which is the decayed remains of organisms; water; and air. Humus is found in topsoil.

Parent Material. The source of the weathered mineral matter from which soil develops is called and is a major influencing a newly forming soil. Either bedrock or a layer of unconsolidated deposits. Nature of the parent material influences in 2 ways. 1) will affect the rate of weathering thus rate of soil formation.

mechanical weathering is influenced by 1) temperature so, frost wedging plays a big role and 2) a deep slope makes rocks more susceptible to falling down due to gravity regolith also known as soil, this is a layer of weathered, unconsolidated

material that contains organic matter and is capable of supporting plant growth

Chapter 5 Weathering Soil And Mass Movement

Soil forms through accumulation and decay of organic matter and through the mechanical and chemical weathering processes described above. The factors that affect the nature of soil and the rate of its formation include climate (especially average temperature and precipitation amounts, and the consequent types of vegetation), the type of parent material, the slope of the surface, and the amount of time available.
