We can use

permutations and combinations to help us answer more complex probability questions. Example 1. A 4 digit PIN is selected. What is the probability that there are no repeated digits? There are 10 possible values for each digit of the PIN (namely: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9), so there are  $10 \times 10 \times 10 \times 10 = 10^4 = 10000$  total possible PINs.

Permutations and combinations are part of a branch of mathematics called combinatorics, which involves studying finite, discrete structures. Permutations are specific selections of elements within a set

where the order in which the elements are arranged is important, while combinations involve the selection of elements without regard for order.

Combinations and Permutations What's the Difference? In English we use the word "combination" loosely, without thinking if the order of things is important. In other words: "My fruit salad is a combination of apples, grapes and bananas" We don't care what order the fruits are in, they could also be "bananas, grapes and apples" or "grapes, apples and bananas", its the same fruit salad.

Definition of

Permutation

Combination.

Permutation is explained as the series of  $r$  terms that can be completed out of total  $n$  number of things.

Permutations are often represented by  $nPr$

which is equivalent to

$\frac{n!}{(n - r)!}$  The various arrangement of a particular number of undertakings by assuming either few or

whole at once is known as permutations.

So, each of the  $x$  combinations gives rise

to  $r!$  permutations. So,  $x$  combinations will give rise to  $x \times (r!)$ . Consequently, the number of permutations of  $n$  things, taken  $r$  at a time is  $x \times (r!)$  and it is equal to  $n P r$ . So,  $x \times (r!) = n P r. \Rightarrow x \times (r!) = n! / (n - r)!$
