Buoyancy Questions and Answers | Study.com

To answer this, we'll need to remember the expression for buoyant force. The above expression tells us that the magnitude of the buoyant force is

proportional to the density of the water or fluid, the volume of the water displaced, and the acceleration due to gravity.

Buoyant Force - AP Physics 2 - Varsity Tutors

To calculate the buoyancy, we need the volume of displaced water, which is the volume of the ball because it is being held completely submerged. The buoyant force is equal to the weight of that volume of water. That's a lot stronger than the 6.1N downward pull of gravity, so the

Introduction You've

heard that oil floats on water. You also know that ice cubes normally float in a glass of water. Why? What causes some things to float in water (corks, ice, dogs) and some to sink in water (rocks, metal spoons, mobsters)?

Solution: When immersed in water, the object is buoyed up by the mass of the water it displaces, which of course is the mass of 8 cm³ of water. Taking the density of water as unity, the upward (buoyancy) force is just 8 g. The apparent weight will be (36 g) - (8 g) = 28 g.

Buoyancy - PhET

True story or not, this amusing tale illustrates Archimedes' development of a key principle of buoyancy:

the buoyant force (F_B) on an object is equal to the density of the fluid, multiplied by the volume of the fluid displaced (which is also equal to the volume of the submerged portion of the object), multiplied by the gravitational field strength.
