How is a nonlinear analysis created? - Graitec

Whenever a material in the model demonstrates a nonlinear stress-strain behavior under the specified loading, nonlinear analysis must be used. Nonlinear analysis offers many types of material models. The induced displacements are small enough so that you can ignore the change in the stiffness caused by loading. Nonlinear analysis offers a large deformation option when defining the material properties of a solid component or a shell.

Non-linear Static Analysis A non-linear analysis consists in the incremental application of loads. During the calculations, loads are not considered at a specific time, but they are gradually increased and solutions to successive equilibrium states are performed.

Non-linear Static Analysis

Non-Linear Static : the difference with the above reference is only in the first part that is the relationship is not linear (it does not follow straight line path)but still its static. Linear Dynamic : the relationship is linear but the load is applied very fast and the magnitude varies with time. inertial forces developed in masses are considered, so that's why dynamic.
