In computer science, model checking or property checking is a method for checking whether a finite-state model of a system meets a given specification. This is typically associated with hardware or software systems, where the specification contains liveness requirements as well as safety requirements. In order to solve such a problem algorithmically, both the model of the system and its specification are formulated in some precise mathematical language. To this end, the problem is formulated as

Abstract. This work presents a modular approach to temporal logic model checking of software. Model checking is a method that automatically determines whether a finite state system satisfies a temporal logic specification. Model checking algorithms have been successfully used to verify complex systems. However, their use is limited by the high space requirements needed to represent the verified system.
