Autoclave Aerated concrete is cured in an autoclave – a large pressure vessel. An autoclave is normally a steel tube of 3m diameter and 45 meters long. Steam is fed into the autoclave at high pressure, typically reaching a pressure of 800kPa to 1200 KPa and a temperature of 180°C. Fig 3: High-Pressure tank for Steam Curing.

Autoclaved aerated concrete is light coloured. It contains many

small voids (similar to those in aerated chocolate bars) that can be clearly seen when looked at closely. The gas used to 'foam' the concrete during manufacture is hydrogen formed from the reaction of aluminium paste with alkaline elements in the cement.

Autoclaved aerated concrete combines insulation and structural capability in one material for walls, floors, and roofs. Its light weight/cellular properties make it easy to cut, shave, and shape, accept nails and screws readily, and allow it to be routed to create chases for electrical conduits and smaller-diameter plumbing runs.

Autoclaved aerated concrete is a versatile lightweight construction material and usually used as blocks. Compared with normal concrete (ie.dense concrete) has a low density and excellent insulation properties. Due to the formation of air voids to produce cellular structure, hence low density is achieved.

Highly porous building materials like aerated autoclaved concrete are characterized by low thermal conductivity and high mechanical strength, which both strongly depend on porosity. The influence of porosity distribution on the compressive strength of aerated autoclaved concrete was investigated by using finite element analysis and multiaxial Weibull theory.

Properties of Aerated Concrete Use of foam concrete has gained popularity not only because of the low density but also because of other properties mainly the thermal insulation property. Aerated concrete is made in the density range from 300 kg/m³ to about 800 kg/m³.
